

Abstract

The invention relates to a film holding apparatus for the holding of an
5 intermittently transmitted motion picture film. The film holding apparatus
has a film track for the guiding of the motion picture film and a registra-
tion device which can be moved from a release position into an engage-
ment position. In the engagement position, the registration device engages
10 into the transport plane of the motion picture film to fix a motion picture
film guided in the film track in an exact position. At least one alternative
position can be selected alternatively to a reference position for the en-
gagement of the registration device into the film transport plane.
